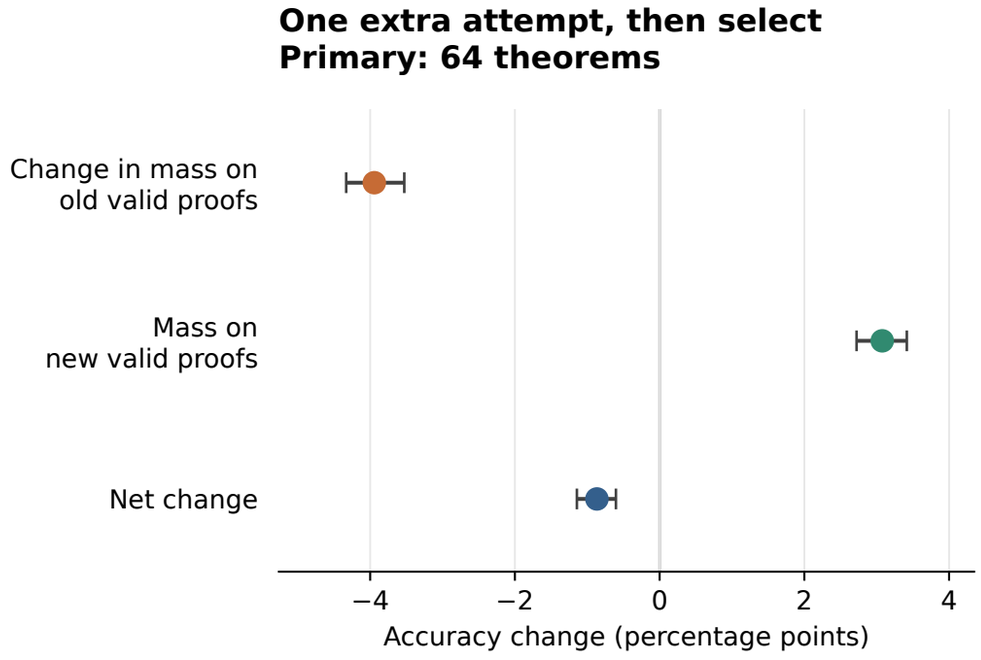
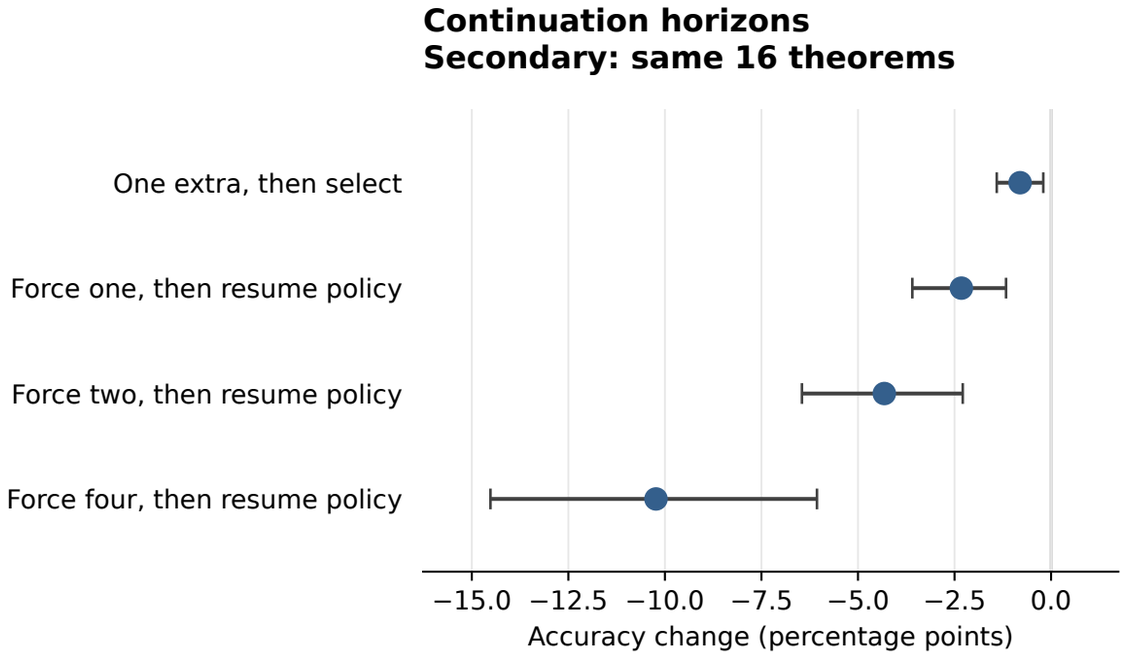
Held-out test: continuation under categorical proof selection





Changes compare continuation with selecting from the proofs already available. Correctness integrates categorical proof selection; mass is selection probability on valid proofs.
Force one/two/four means a minimum number of additional attempts before resuming the policy. All old candidates remain available.
Equal weights for two checkpoints and forced states after attempts 1 and 2. Bars: 95% family-stratified theorem-bootstrap intervals, conditional on these models and draws.
The right panel uses the same 16 theorems from the original 64/32/16/16 panels. Intervals do not test differences between horizons.
