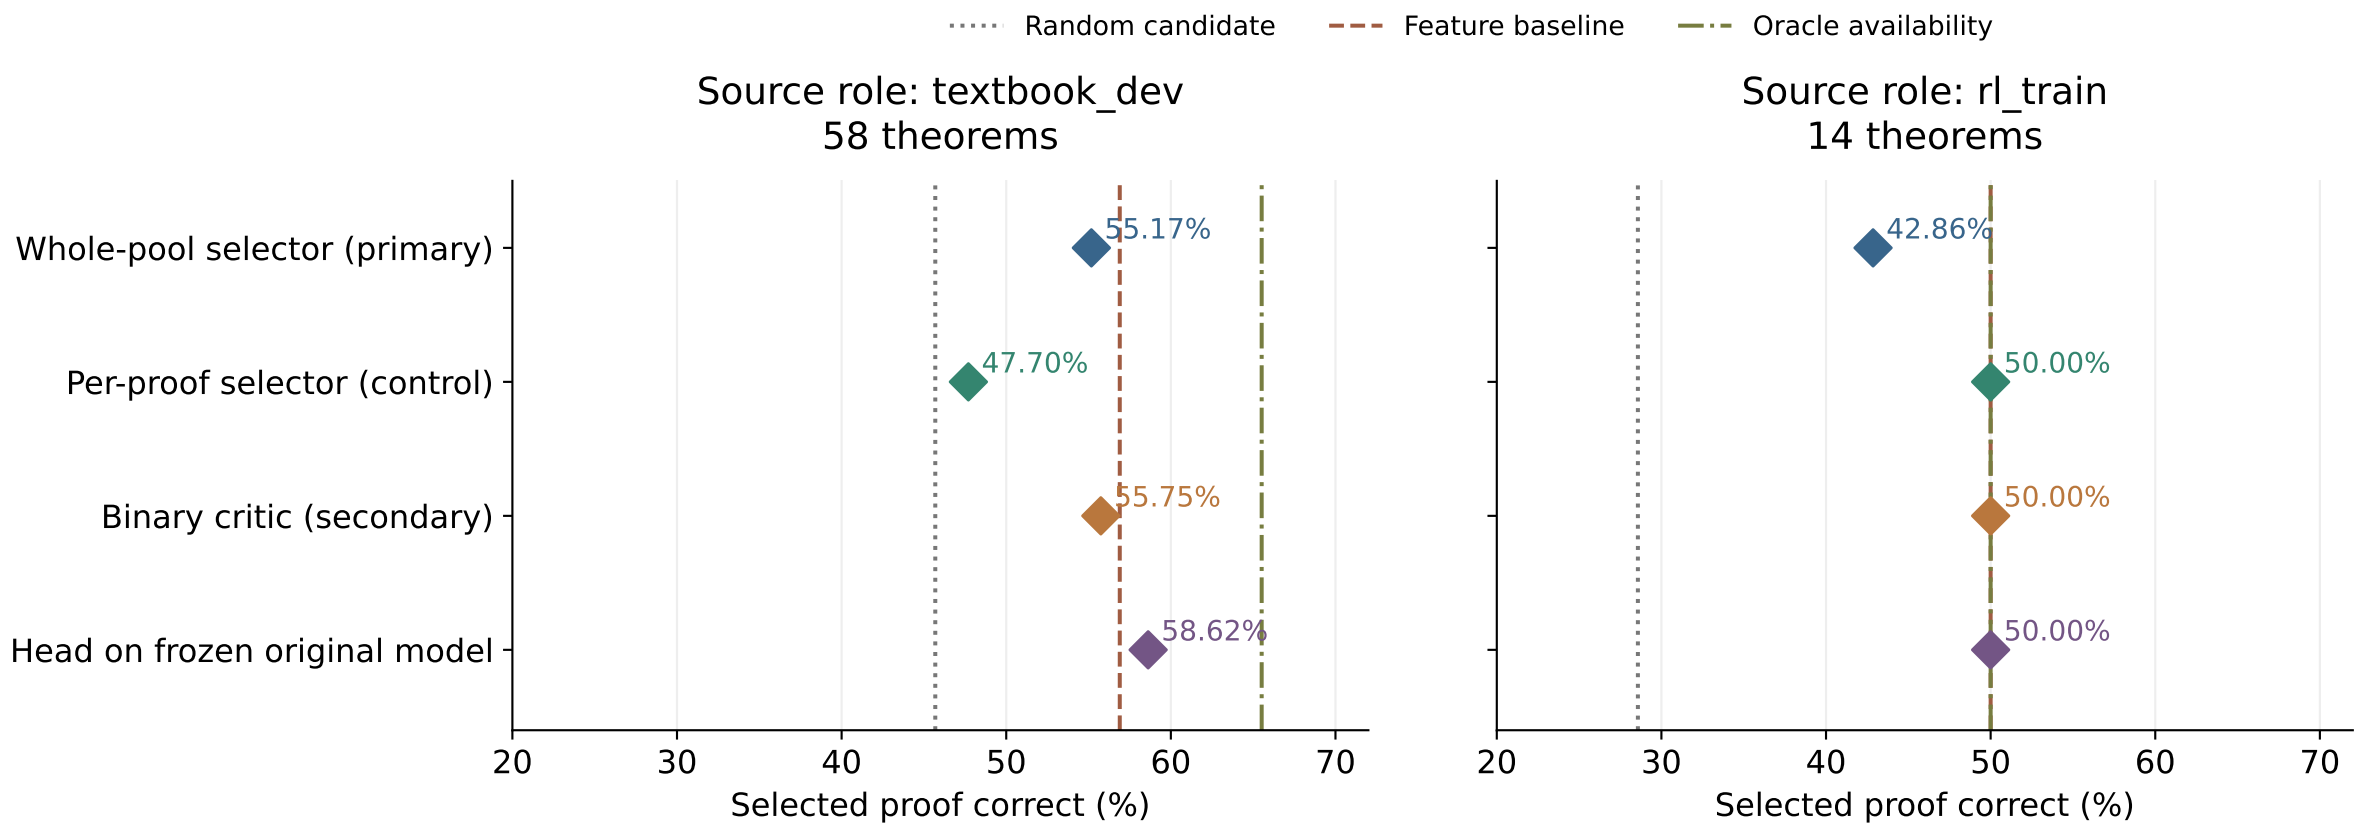
Historical source roles: selecting a proof from eight attempts



72 reused benchmark theorems; source-role labels are not exposure counts. All models and policies were chosen on MAIN development.

Points: three-seed means, except the single frozen head. Role panels are descriptive; paired 72-theorem uncertainty is reported separately.

Oracle uses held-back verifier labels, unavailable at inference. No historical tuning. All 72 syntax-then-likelihood: 59.72% (not plotted by role).
